Government Higher secondary school, Silamalai

- 2020-2021
- HSC | Percent: 79%

PROJECT EXPERIENCE

Online Voting System

- An online voting system is a digital platform allowing users to vote electronically in elections or decision-making processes. It replaces traditional paper-based voting with a secure, efficient, and accessible method that can be used remotely via the Internet or in controlled environments like polling stations.
- With the advancement of technology, online voting systems have emerged as a modern solution to improve the efficiency, transparency, and accessibility of elections. These systems are designed to handle various types of elections, including government elections, corporate decision-making, university students council elections, and services
- An online voting system is a step towards a more inclusive and efficient electoral process. However, it must be implemented with robust security, reliable authentication methods, and public trust measures to ensure fair and transparent elections.
